★ Objective 1: Hands On for Scripting Lesson 1/2 [↗](#)

### roman\_numerals.sh [↗](#)

Write a shell script that converts given Roman Numeral to Decimal:

| <b>Roman Numerals Basic Number Conversion Chart</b>  |                         |
|--|-------------------------|
|  <b>cuemath</b><br>THE MATH EXPERT |                         |
| Decimal Number   | Symbol of Roman Numeral |
| 1  | I                       |
| 5  | V                       |
| 10   | X                       |
| 50   | L                       |
| 100  | C                       |
| 500  | D                       |
| 1000   | M                       |

The script should take one argument (the roman numerals) and print its decimal value.

#### Constraints:

- For the sake of simplicity we can assume that all the inputs are valid.
- The smallest possible numerals is **I (1)** and the largest is **MMMCMXCIX (3999)**.

Example outputs:

```
1 $ ./roman_numerals.sh MCMLXXXIV
2 1984
3 $ ./roman_numerals.sh MMXXV
4 2025
5 $ ./roman_numerals.sh MMMCMXCIX
6 3999
```

#### **Algorithm:**

- Iterate through the numerals backwards.
- Assign a value you will add based on the numeral you encounter:
  - M - 1000
  - D - 500
  - C - 100
  - L - 50
  - X - 10
  - V - 5
  - I - 1
- Always store the value of the previous numeral (you can initialize it as 0).
- If the previous value is greater than the current one, it means we need to subtract from the total. Some examples of such composites:
  - CM (1000 - 100 = **900**)
  - XL (50 - 10 = **40**)
  - IV (5 - 1 = **4**)

#### **Hint:**

It is better to check whether the previous value was larger than the current one, after you already mapped the current numeral to a decimal value.

## count\_vowels.sh

Write a shell script that counts the number of vowels (**a, e, i, o, u** - letters) in a given word.

`count_vowels.sh` should accept one argument. It should count vowels regardless of casing.

Example outputs:

```
1 $ ./count_vowels.sh "tentek"
2 2
3 $ ./count_vowels.sh "cat"
4 1
5 $ ./count_vowels.sh "TENTek"
6 2
7 $ ./count_vowels.sh "CAT"
8 1
```

#### **Hint:**

You could solve this using if statements but an easier approach would be using Regular Expressions (Regex). You might have already encountered Regex while using the `grep`, `sed` or `awk` commands.
